

A photograph of a man in a grey shirt carrying a young child on his shoulders. They are both looking upwards with their arms raised, holding hands, against a bright blue sky with scattered white clouds. The man has a slight smile, and the child looks happy and excited.

**Trust**  
**Assumptions**  
**Trustworthiness**  
**Assurance**

## Table of Content

---

1. Opening: what is so special about services ?
2. What Charlie Chaplin and Future Internet have in common ?
3. Can we define “trust” problem ?
4. Can we fix “trust” problem ?
5. A rather good solution
6. “Trust” game for audience
7. Going even further: a perfect solution
8. Where do we put cloud in all this ?
9. Nessos recommendations 2011

---

## Opening statements

---

- ▶ Service-centric view is changing the way IT infrastructure and applications will be managed and delivered
- ▶ Applications will utilise components out of different domains of control, obeying separate security policies, asking for diverse security and dependability qualities
- ▶ Components may be owned and operated by different organisations (trusted or not)
- ▶ Services will be shared between many consumers

We are all part of an experiment in FI-trust  
whose outcome is unclear

---

Many add-on security solutions are trying to ensure the continuation of the physical world trust assumptions – not prompting to rethink trust in e.g. composition of services

# Trust is a problem ?

- Services are not trusted due to:
  - Market pressure
  - Perception by large mass of users;
  - Information managed by a restricted group of "experts", increasing info-exclusion;
  - Information mismanaged, prompting for cyber-crime, e-frauds, cyber terrorism and sabotage
  - Lack of privacy
  - etc

# Trustworthiness is a problem ?

- Services are not trustworthy because of:
  - The poor engineering/programming practices
  - Not taking security requirements from the beginning or not expressing them correctly
  - Risks were not treated properly
  - Security mechanisms is not scalable/interoperable...
  - Operational context was not taken into account...
  - etc

# Real-Time End2End Super Mega Deluxe Assurance Management

- ▶ Assurance process more agile and flexible
  - ▶ Share security/risk information with stakeholders (e.g. modular tool (COPTA))
  - ▶ Automate the process of a...

---

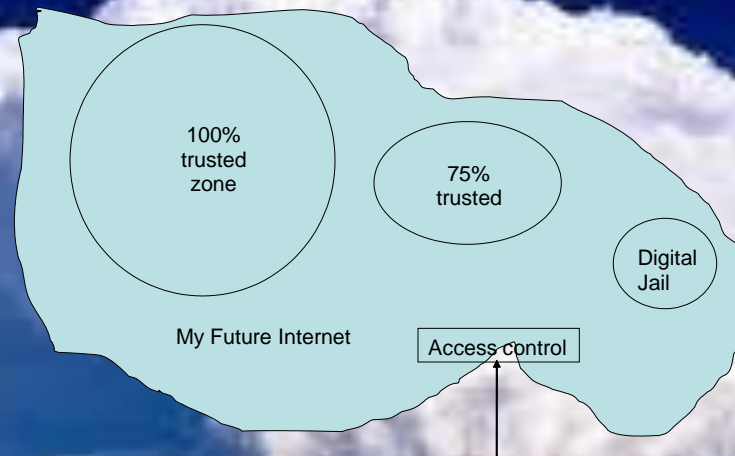

# From Assurance to Assumptions Management ?

---

- ▶ Quality of Experience and the link between trust and trustworthiness
- ▶ A global view of service trust and trustworthiness which encompasses also socio-economical aspects
- ▶ Devising mechanisms to validate or manage assumptions including:
  - secure services architecting and engineering;
  - design- and run-time validation;
  - simulations;
  - ability to monitor, measure, test and predict the security status of a system;
  - reputation and similar mechanisms
  - LINK PHYSICAL AND REAL WORLD !!!

# If computing sky is getting “cloudy”...Trust will depend on “weather conditions”...

Infrastructure view: Expanding boundary (include mobile access ) and/or Contracting boundary (exclude outsourcing staff PC, external B2B server...)

# Recommendations 2011

## Nessos research directions

- ▶ Security Requirements engineering:
  - Express higher level goals/contraints (e.g. privacy) such as social, economic and legal
  - Enable automatic verification (e.g. large scale real-life scenarios)
- ▶ Assurance and metrics
  - Assurance “case” or “profile” that include operational (e.g. outsourcing) issues
  - Automation of security model checking
  - Certification and audit frameworks
  - Link between early assurance (e.g. model check, stepwise refinement) and implementation assurance (e.g. code level testing)
- ▶ Secure service composition
  - Dynamicity of security “contracts”
  - Testbeds and risk “knowledge base”
  - Partial, inadequate, uncertain or untrusted information about service properties
- ▶ Risk and Cost aware SDLC
  - Dynamic risk allocation and sharing
  - Modularity

# Thanks
